numicon professional development

Maths in action!

Using structured manipulatives to discover relationships in maths and make connections clear

In mathematics and statistics, students explore relationships in quantities, space and data and learn to express these relationships in ways that help them make sense of the world around them.

NZ Curriculum

numicon professional development

What does this mean for teaching?

- Open ended tasks and challenges
- Effective questioning strategies
- Making Skills and Capabilities explicit
- Opportunities to work collaboratively
- More self-directed learning
- Making connections

© Oxford University Press 2015

numicon professional development

Why is mathematics so difficult to teach and learn?

- Maths involves abstract ideas.
- Maths involves spotting patterns and making generalisations.
- It requires the understanding of number relationships.

Written numerals and symbols alone do not make this easy...

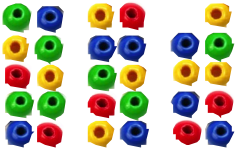

© Oxford University Press 2015

numicon professional development

Counting – a life skill, but clumsy for calculating

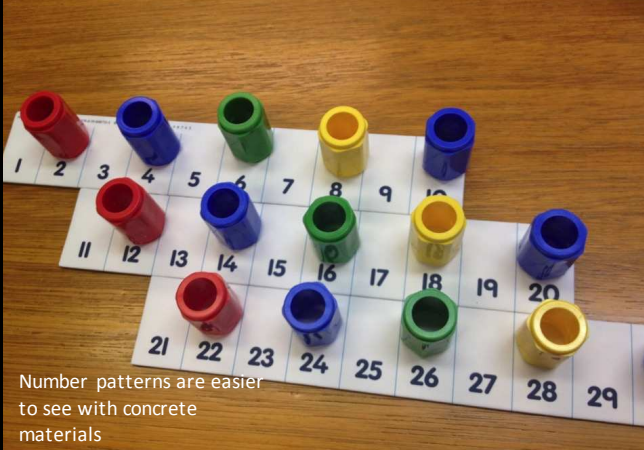

Counting

Patterning leading to calculating

© Oxford University Press 2015

Number patterns are easier to see with concrete materials

© Oxford University Press 2015

numicon professional development

Multiples of 9

© Oxford University Press 2015

Some key factors influencing mathematical learning

- ability to sequence
- working memory/auditory, visual
- processing
- language skills
- motor skills
- attitude
- teaching approach

© Oxford University Press 2015

Numicon is...

© Oxford University Press 2015

Exploring relationships!

A pattern shows a relationship and more concepts than just counting

Structured number representations show many patterns: odds and evens, +1 and -1, +2 and -2, doubles and halves, x 3 pattern sequence, x 5 pattern sequence, teens, place value, fractions and decimals, negative numbers and more!

10 + 5 = 15

Copyright OUP 2015

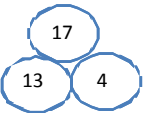

Generalising!

Patterns in number allow us to Generalise. This enables us to solve problems

The Pan Balance demonstrates equivalence and further relationships of numbers

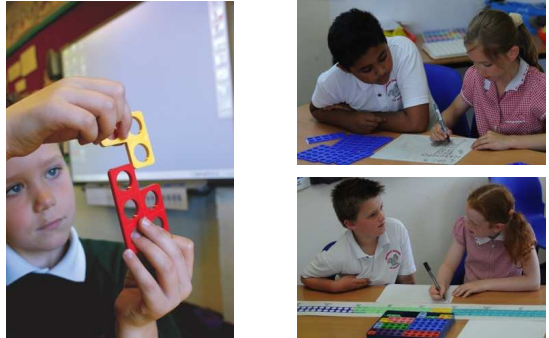

74 + 13 = 87

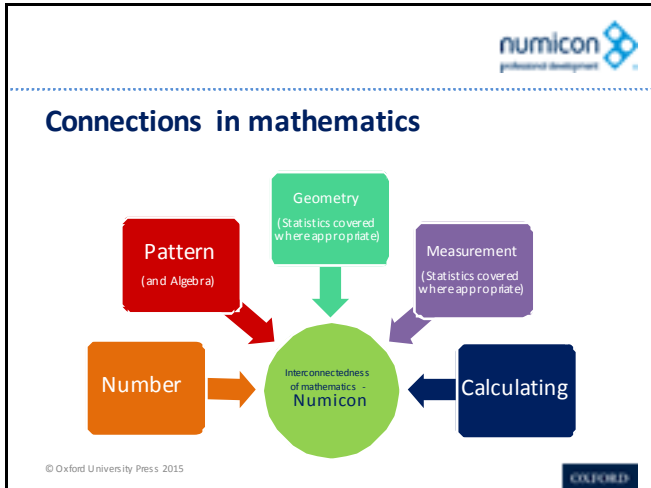

© Oxford University Press 2015

Communicating mathematically!

© Oxford University Press 2015

Exploring relationships

Seeing a pattern is at the heart of mathematical thinking...

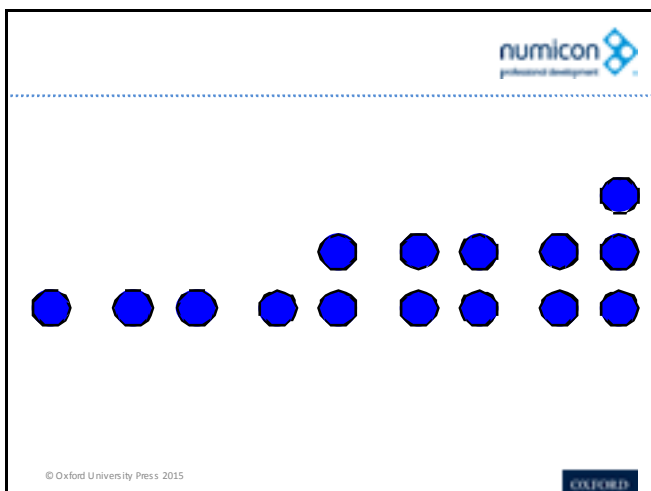

© Oxford University Press 2015

In context...

© Oxford University Press 2015

Constructing meaning for Numicon Shapes

© Oxford University Press 2015

Powerful patterns

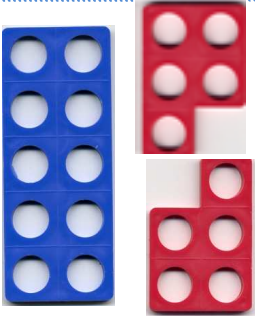

- Opportunity to explore
- Opportunity to talk
- Opportunity to reason
- Attributing their own properties (adjectives) leading to names (nouns) and associations

© Oxford University Press 2015

Structure enables...

- To know a number
- In relationship with others

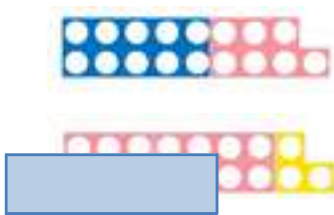

Talk about all the mathematical ideas you can see

© Oxford University Press 2015

Algebra- patterns of structures

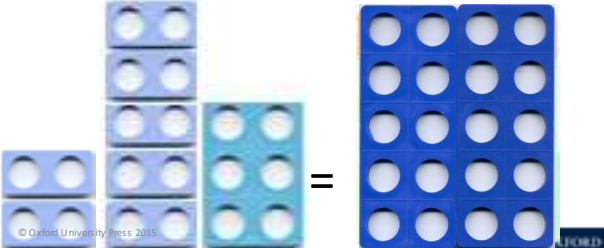

$2a + 3 = 17$
 What is a?
 $14 + 3 = 17$
 $7 + 7 + 3 = 17$
 $a = 7$

© Oxford University Press 2015

If $x = 2$

$x^2 + 5x + 6 = (x + 3) \times (x + 2) + 6$
 $2^2 + 5(2) + 6 = (2 + 3) \times (2 + 2) + 6$
 $4 + 10 + 6 = 5 \times 4$
 $20 = 20$

© Oxford University Press 2015

Numbers and the Number system- Place Value

tens	ones
	
1	7

What will Numicon look like in our classroom?

© Oxford University Press 2015 OXFORD

Making pictures shapes and patterns

© Oxford University Press 2015

What is GMS with Numicon?

“This is a square.”

“A square has four equal sides and four right angles.”

“This is a square because...”

Starting to make deductions at an informal level – inter relationships between shapes

Use of language and beginning of analysis

Recognition and visualisation – appearance through exploration and play

Design and collaborate in a formal level

© Oxford University Press 2015

Investigation

Low threshold, high ceiling investigations with Numicon - Cross Totals

- Use Numicon Shapes 1, 2, 3, 4 & 5
- Place one shape in each square so the horizontal and vertical totals are the same
- Discuss any interesting patterns you notice?
- Odds and evens?
- Algebraic expression

© Oxford University Press 2014

Investigation

Low threshold, high ceiling investigations with Numicon – Six squared

- Mark off six by six on the baseboard template
- Together explore by filling it with your choice of shapes.
- Record what you have done on paper
- Consider multiples, brackets, algebraic expressions

© Oxford University Press 2014

Investigation

Low threshold, high ceiling investigations with Numicon – Investigating polygons GMS 3

Activities to explore

- Making triangle, square, rhombus, pentagon, ...
- How does the sequence of the shapes grow? Look at the inside angles.
- Make irregular shapes from the list above

© Oxford University Press 2014

What Numicon can do to make a difference for children!

- Children with learning differences LOVE the visual and hands-on approach
- Children LOVE the problems to solve actively; better than with pen and paper
- Children LOVE being able to talk about their learning and work with a partner and groups
- It's confidence building! A real plus for twice exceptional children
